This looseleaf Atlas is one prototype product of experiments in land use change detection using remote sensors on aircraft and

Thousands of Feet

San Francisco 200-600/25

This experimental map series shows changes in land use from 1970 to 1972 in the nine-county San Francisco Bay Region. Land use and change for areas 10 acres and larger are derived primarily by interpretation of high-altitude color infrared photography. A limited field check also has been made. Sensor data and census data are aggregated by census tract, by county, by region, and by urban area, 1970 and 1972. The latter uses visible land use boundaries so that changes occurring between census years can be monitored using remote sensors aboard aircraft and/or satellite. The land use maps and data augment Earth science materials from the San Francisco Bay Region Environment and Resources Planning Study, a joint effort by USGS and U.S. Department of Housing and Urban Development. Inquiries and suggestions may be addressed to Director, U.S. Geological Survey, Reston, Virginia, 22092.

County boundary.... Census tract boundary..... Boundary of Urban Area, 1970 based on land use..... Boundary of Urban Area added between 1970 and 1972..... From-To Commercial, Public and Private Services..... 0 0 1 1 Industrial, Extractive..... 2 2 Transportation..... 3 3 Multi-Family Residence..... 4 4 Single-Family Residence..... 5 5 Strip and Cluster Development..... Agriculture (Cropland and Pasture,

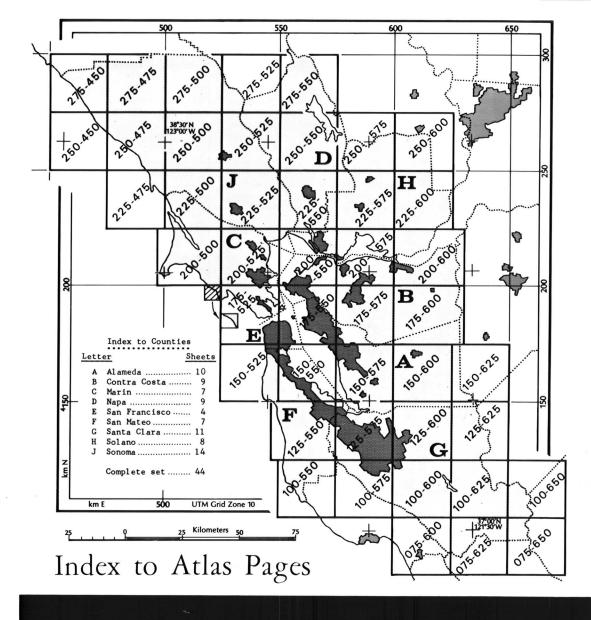

Change polygons are identified by a two-digit number; the first digit identifies the land use in 1970 and the second digit the land use in 1972. For example, a change polygon coded 64 means that the land use changed from Agriculture (6) in 1970 to Single-Family Residence (4) in 1972. Land use in transition is shown by an asterisk (*) following the use code.
